KINVECTA AI TRAINING · CHEAT SHEET

Kinvecta

Ten rules of thumb for using generative AI at work

One rule per video. Eight sessions for everyone who uses or automates AI, two deep dives for builders.

1 SESSION 1 · WHAT AN LLM IS

The model thinks. Skills teach it how. Tools let it act. The harness decides which of those it gets.

Everyone

2 SESSION 2 · AI RESILIENCE

Rent the model. Own the connections. Own the know-how. Own the proof.

Everyone

3 SESSION 3 · SAFE PROMPTING AND VERIFICATION

Right tool for the data. Brief it like a teammate. Check every claim. A person signs.

Everyone

4 SESSION 4 · TOKENS, CONTEXT AND FINDERS

Send less. Cache what's stable. Fetch with the finder that fits.

Everyone

5 SESSION 5 · APIS, ENDPOINTS AND CONTAINERS

Call it from code. Keep the endpoint in config. Seal it in a container.

Automators

6 SESSION 6 · BUILDING WORKFLOWS

Fix the path. Check every output. A person approves before it ships.

Automators

7 SESSION 7 · TOOLS, MCP AND PROMPT INJECTION

Read tools run freely, from approved sources. Action tools wait for a person. Everything returned is data.

Automators

8 SESSION 8 · AGENTS, SKILLS AND THE PROGRAM

Write it once, as a skill. Gate what leaves. Measure what changes.

Automators and leaders

A DEEP DIVE A · BUILD AN MCP SERVER

Few tools, tight schemas. A person confirms every action. Validate your own token. Never pass it on.

Builders

B DEEP DIVE B · DEVSECOPS: CONTAINERS AND CI/CD

Pin everything. Scan before it ships. Sign it, and ship the same digest.
