Kinvecta

TRAIN-THE-TRAINER SERIES · SESSION 8 OF 8

Agents, skills and running the program

Turn what your team knows into shared, safe, measured practice.

7–minute video | Stage 5 | Guide 3.3–3.5 · Part 5

Kinvecta

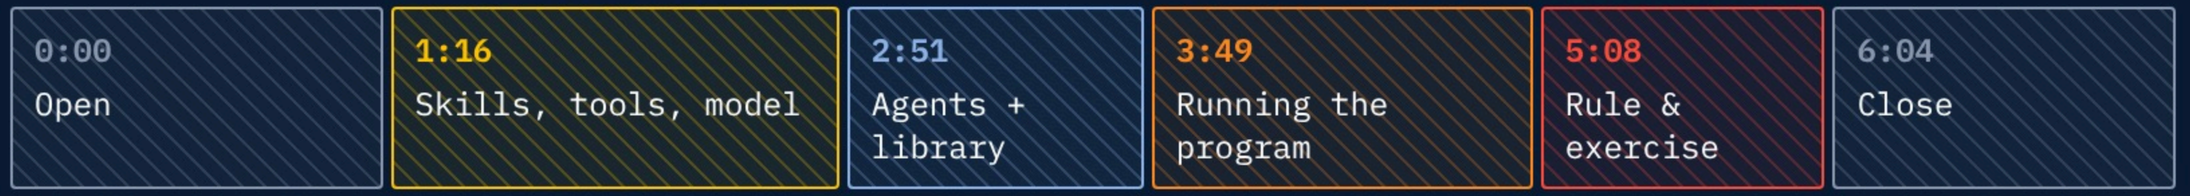

TODAY

By the end, your learners can…

1. Explain how a skill loads, and why it stays cheap
2. Combine a skill, tools and a model into one repeatable job
3. Put guardrails on an agent
4. Plan a rollout by stage, role and measure

CHAPTERS · 7 MIN

drawn to scale

Kinvecta

WHY THIS MATTERS

Three ways an AI program stalls after the first course

01

Know-how walks out the door

The best prompts live in one person's chat history. When they leave, so does the method.

02

Unchecked skills get installed

In one audit, roughly a third of skills in a public registry had a security flaw.

03

Courses end at Stage 1

Courses finish, but nobody checks whether the work actually changed.

The question for this session:

How does know-how become shared, safe, measured practice?

Kinvecta

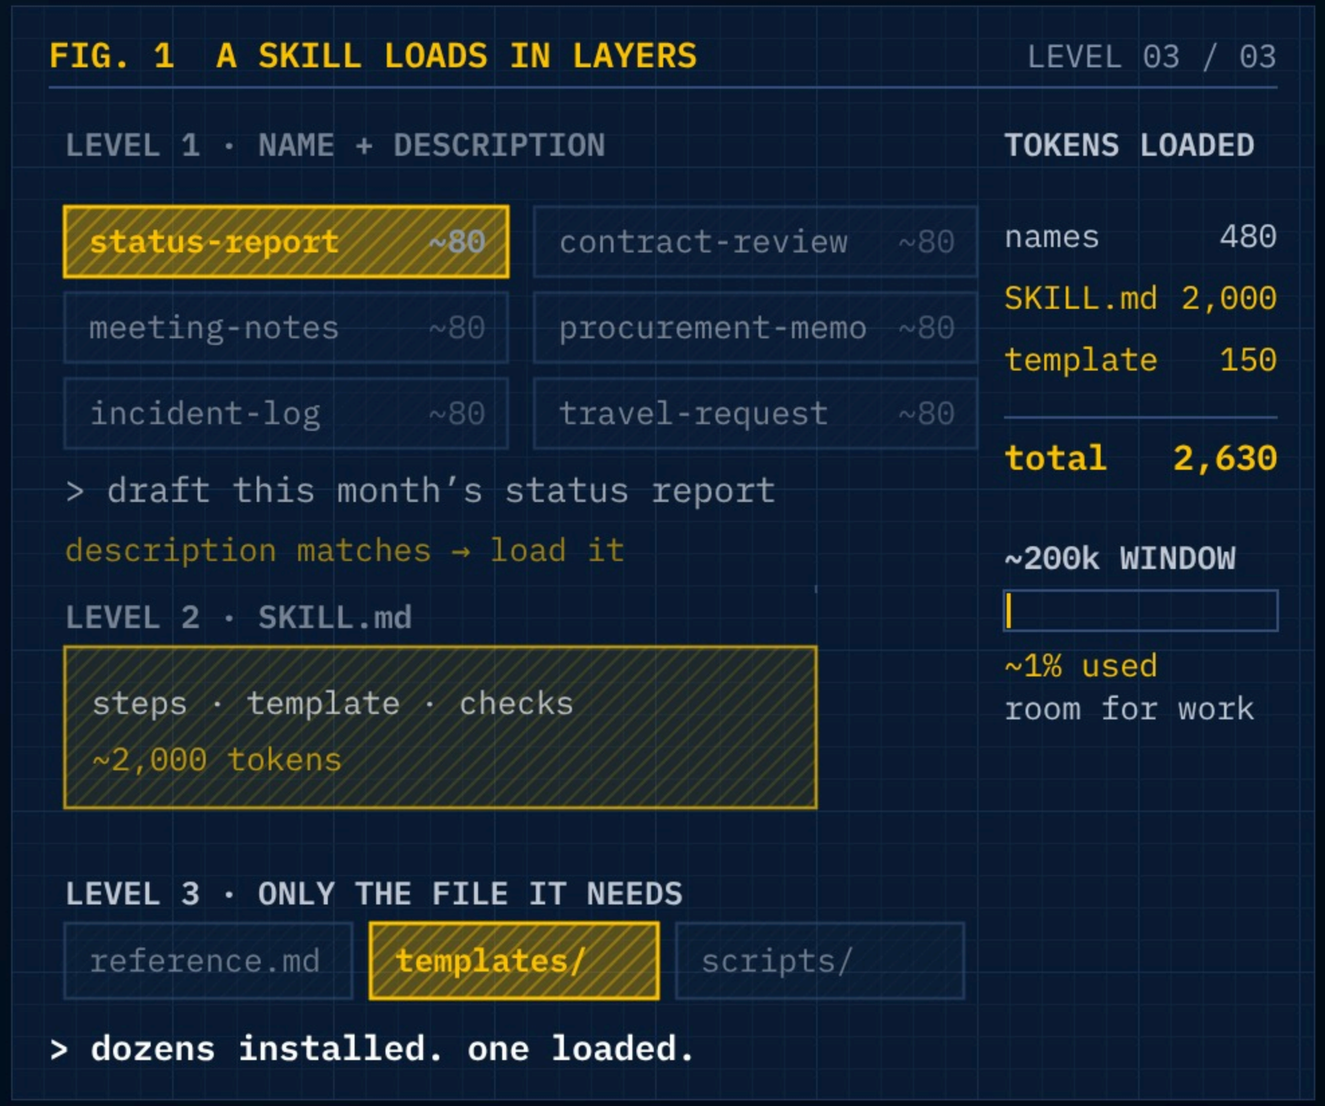

SKILLS DEEP DIVE

A skill is an onboarding guide the AI loads only when needed

A folder, not a file
SKILL.md, plus optional reference files, templates and scripts

The description decides
A vague description = a skill that never fires

Loads in layers
About 80 tokens each until a task calls for it

Kinvecta

A SKILL IS SOFTWARE

Treat every skill like code

01

Read every file

Every SKILL.md and every script, before it is installed

02

Scan and pin versions

Pin = lock to one known version; scan it for known flaws

03

Internal registry

Registry = your approved download shelf; teams install only from it

04

Scripts run in a container

A skill with code never runs loose on a laptop

05

Review self-written skills

An agent that edits its own skill needs a person’s approval

06

Decide who may install

Who can install, write and share skills is set before they are turned on

Kinvecta

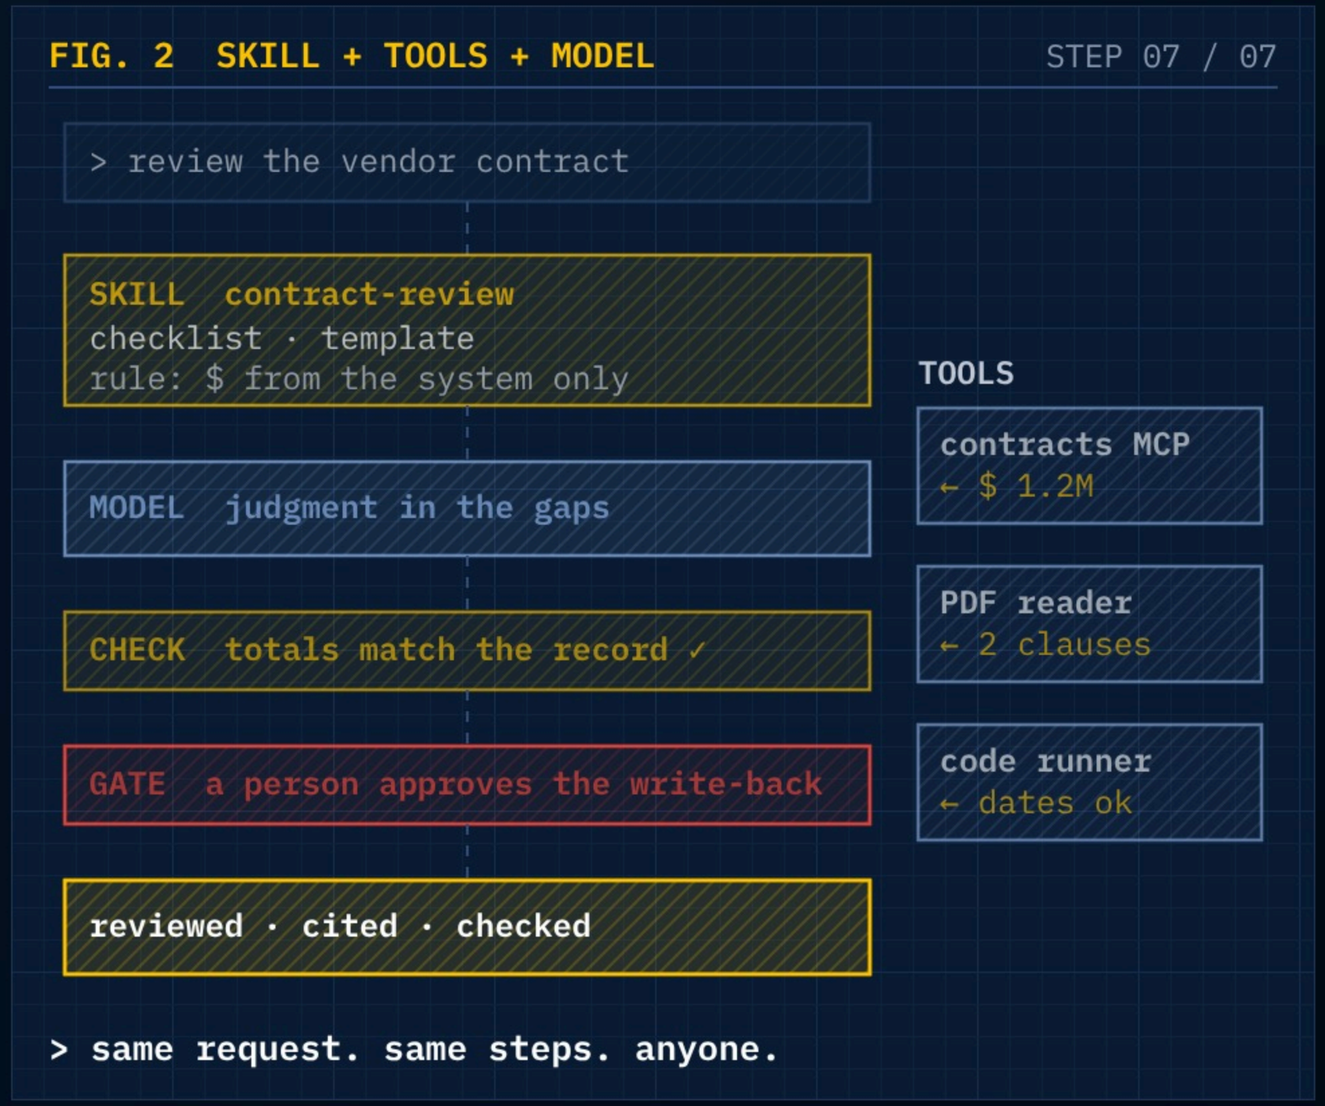

SKILLS + TOOLS + MODEL

Each part does what it is good at

Skill = the method
Steps, template, checks, and what never to do

Tools = facts and actions
Records from live systems, and a way to check the work

Model = judgment in the gaps
Fills the gaps; no longer the source of truth

Kinvecta

AGENTS, STAGE 5

Delegate multi-step work, with guardrails

Runs in a container

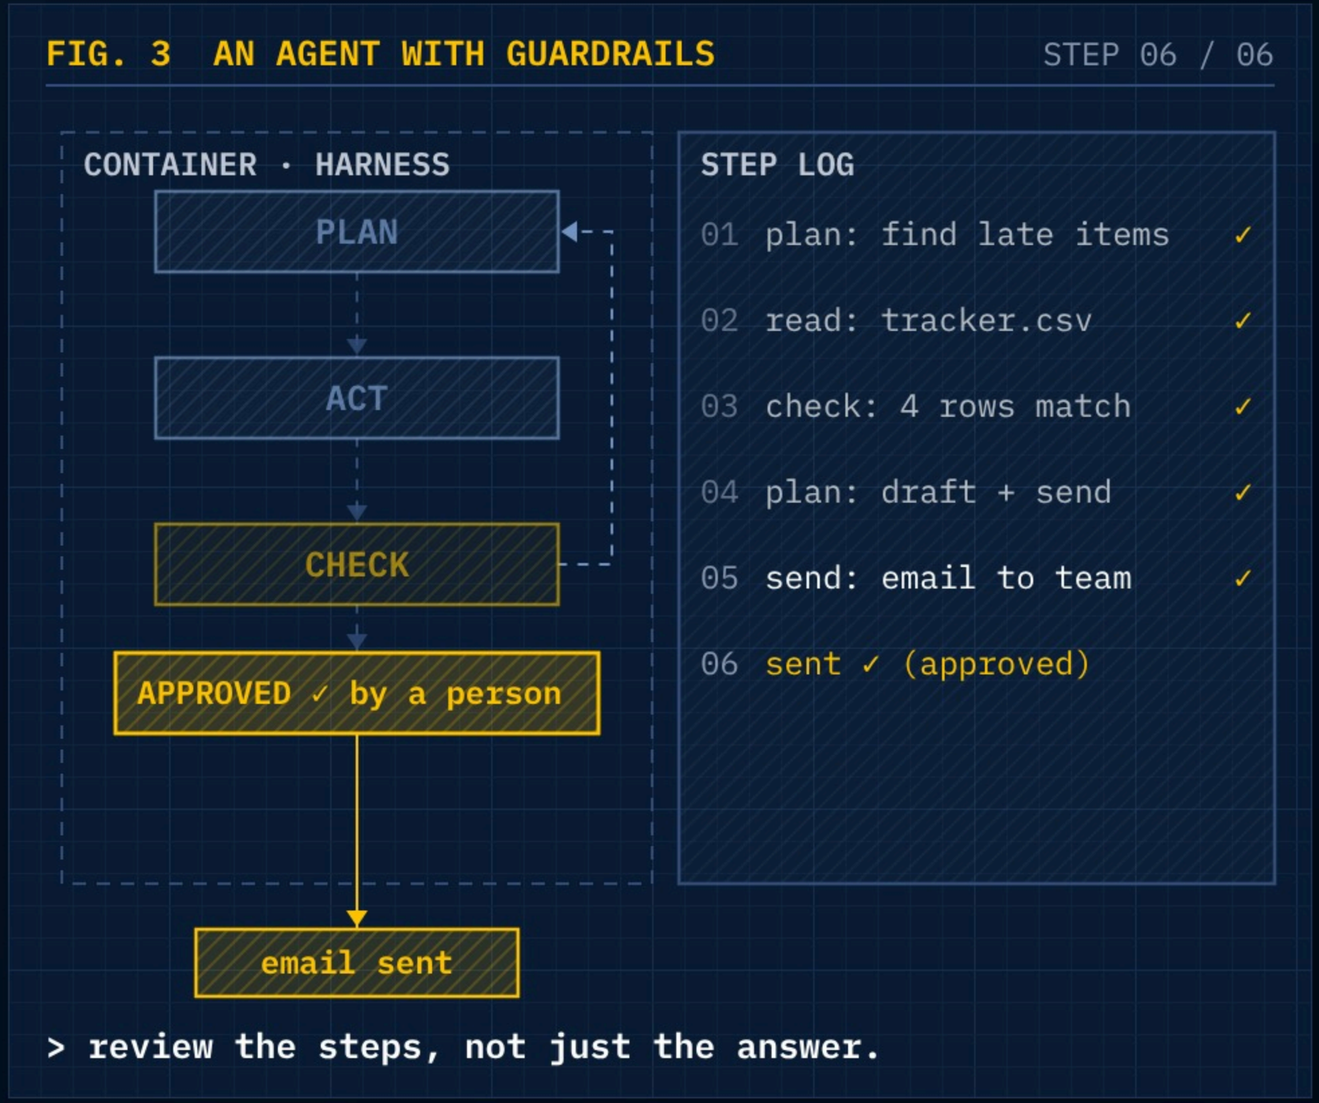

The harness, its skills and their scripts stay sealed in

Every step is logged

Review the steps, not just the final answer

A person approves what leaves

Nothing is sent, written or changed without a yes

Kinvecta

PROMPT AND SKILL LIBRARY

One shared library feeds every chat, script and agent

One home

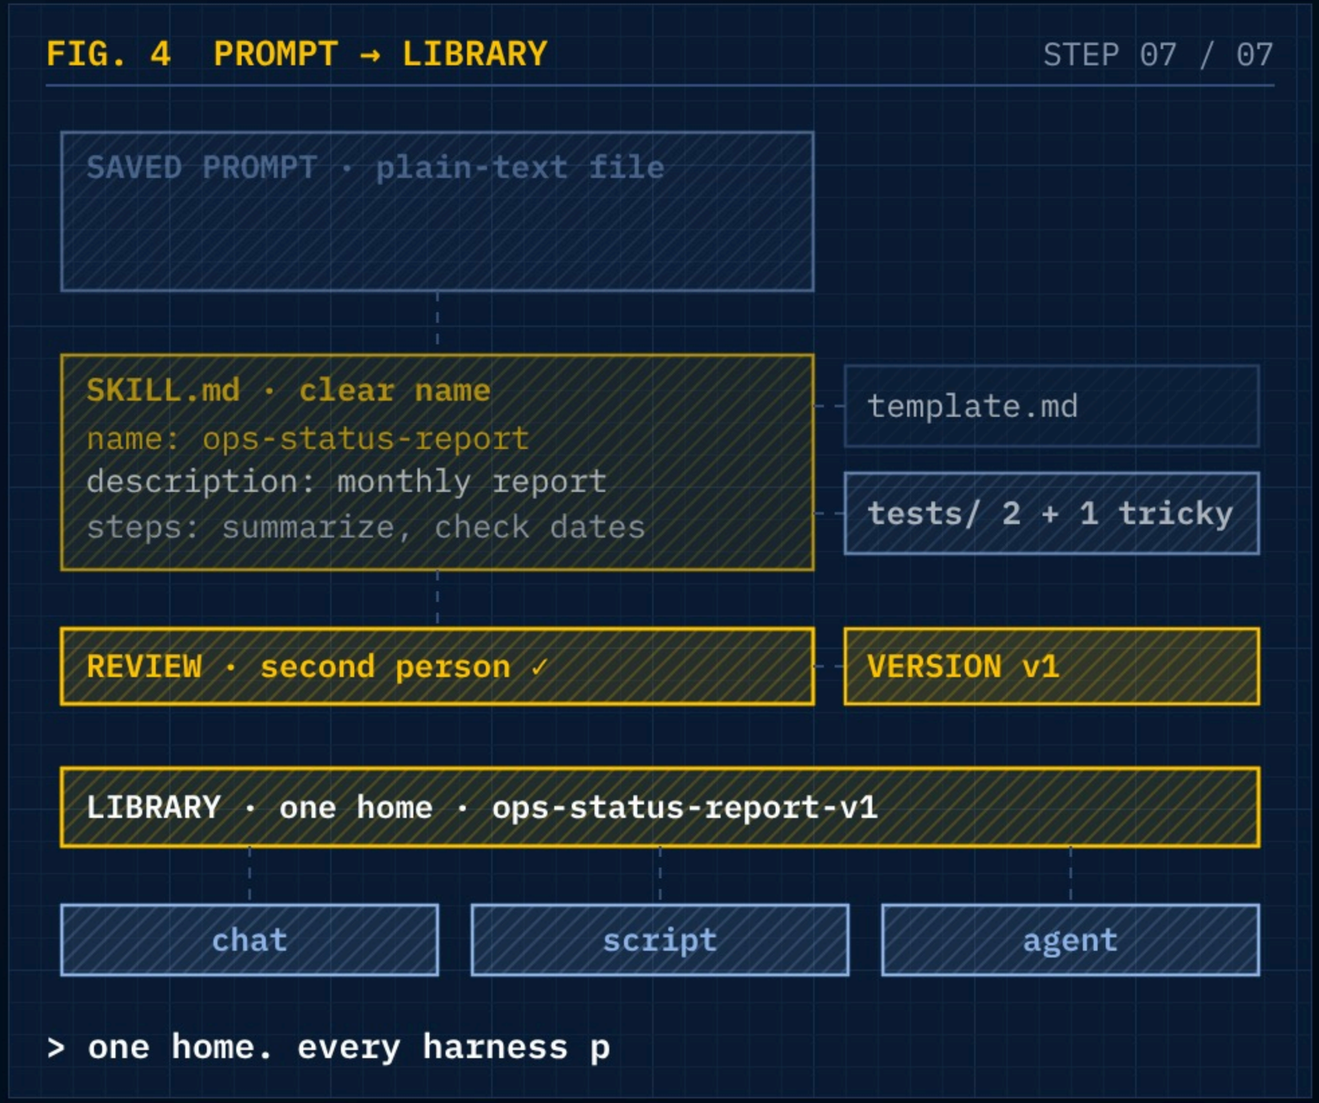

A version-controlled repository every harness pulls from

Reviewed and versioned

A second person approves; every change is a new version

Tested before reuse

Two or three test cases, plus one tricky case

Kinvecta

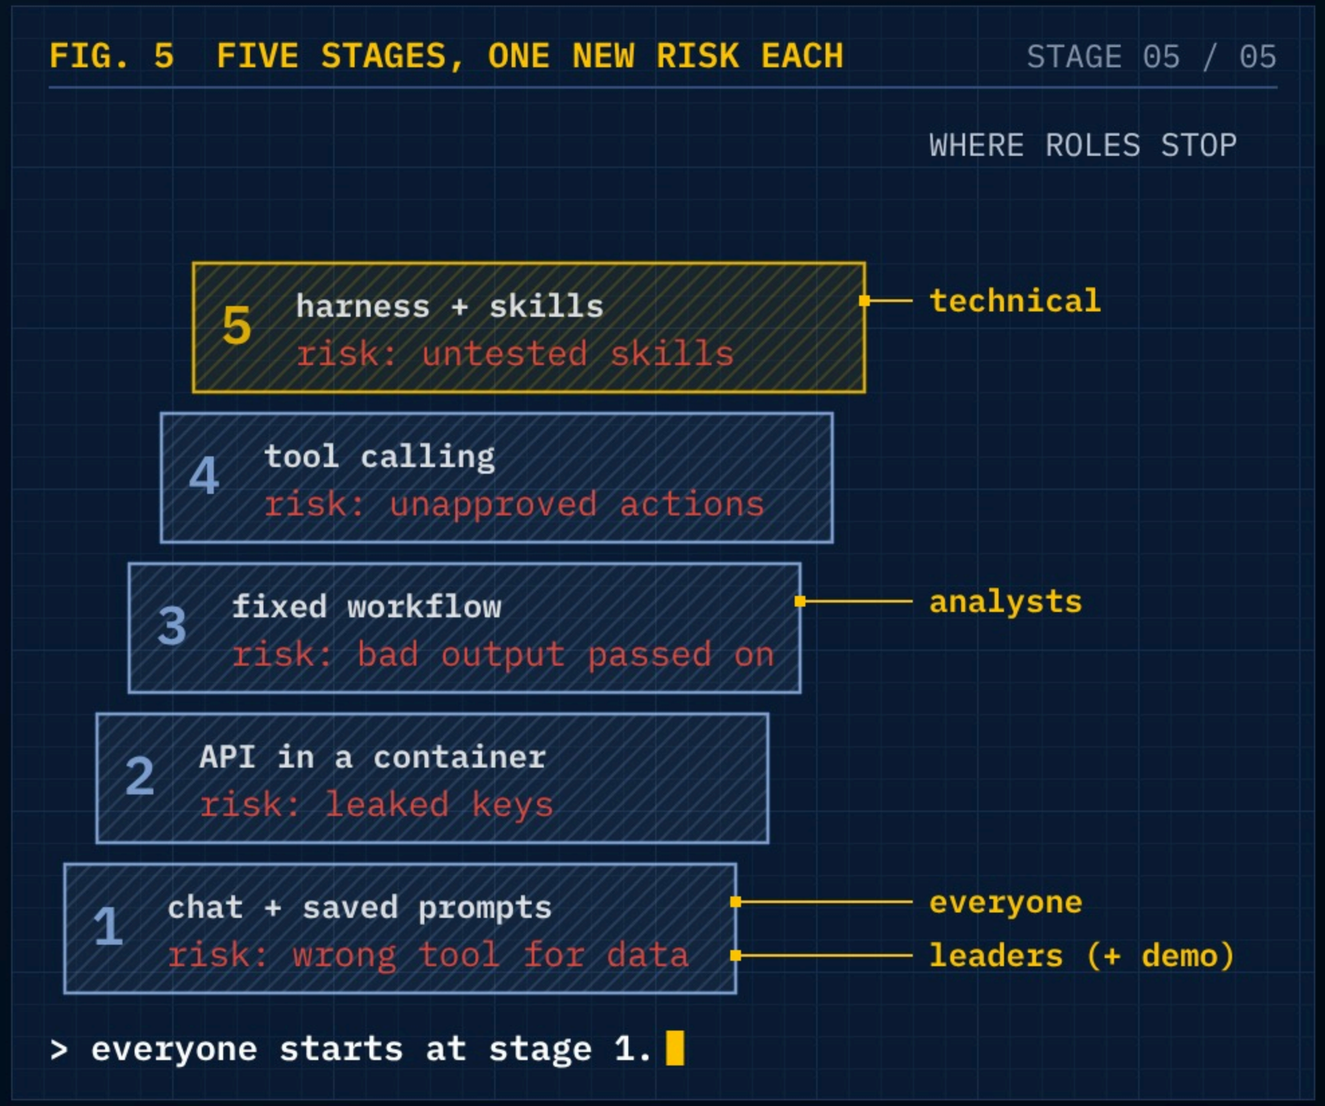

RUNNING THE PROGRAM

Five stages, one new risk each

One new risk per stage
When something breaks, people know which layer to check

Each role stops where its decisions sit
Everyone does Stage 1; technical staff go to 5

Every stage after 1 runs in a container
Chat-only teams can stop at Stage 3

MEASURING RESULTS

Training worked when the work changed

Baselines first

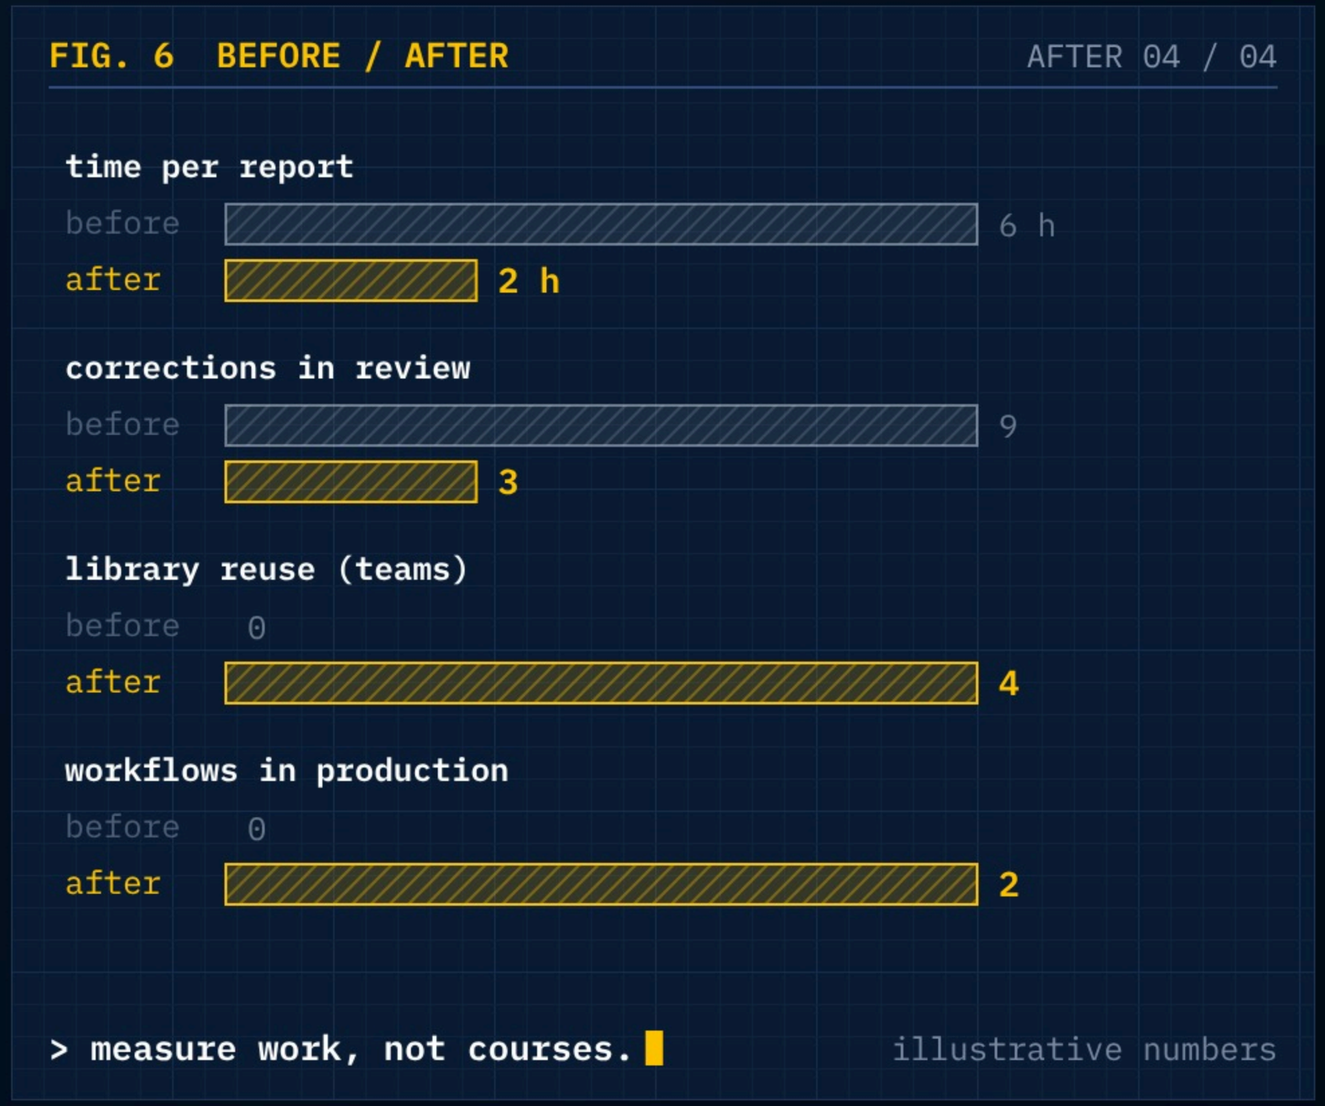

Measure before training starts, or nothing can be compared

Count work, not courses

Time saved, errors caught, reuse, workflows, security findings

Evals before release

Passes its tests before release, and after any change

Kinvecta

THE RULE OF THUMB

Write it once, as a skill.
Gate what leaves.
Measure what changes.

Know-how becomes shared practice when it is reviewed, tested and measured.

Kinvecta

EXERCISE

Package it, then plan it

Pause & try

A Package it · paper

1. Name your Session 3 prompt, and write a description that says when to use it.
2. Write 3 requests that should trigger it, and 2 that shouldn't.
3. Swap: your partner reads only the description and picks which requests trigger.
4. Fix the description until they get 5 of 5.

No harness needed. Stretch / homework: add the template and test cases.

B Plan the rollout

Pilot workflow
One repeat task and the skill it needs

Roles → stages
Who goes to Stage 1, 3 and 5

Three measures
Each with a baseline you can take this week

Review date
When you check the numbers, and who decides

Kinvecta

CHECK FOR UNDERSTANDING

Can every learner answer these?

1

What loads before a skill is triggered?

2

Which stage does everyone complete, and where do analysts stop?

3

What do a skill, tools and a model each add?

4

Where must a person approve an agent’s work?

5

What makes a prompt ready for the library?

6

Name two measures that show training worked.

Kinvecta

SERIES COMPLETE · 8 OF 8

Your next step: one pilot, measured

01 Pick one pilot workflow

↓

02 Take baselines

↓

03 Stand up the library

↓

04 Run Stage 1 for everyone
